## Overview:

Android offers a unified approach to application development for mobile devices which means developers need only develop for Android and their applications should be able to run on different devices powered by Android.

---

## Outlines:

Module 1: The Android operating system is a multi-user Linux system in which each app is a different user.

Module 2: By default, the system assigns each app a unique Linux user ID

Module 3: The system sets permissions for all the files in an app so that only the user ID assigned to that app can access them.

Module 4: Each process has its own virtual machine (VM), so an app's code runs in isolation from other apps.

Module 5: people actively using Android, a Unix-like mobile operating system that runs on phones, tablets, smart TVs, smart watches, and a slew of other devices
